

# AWS API Gateway

Amazon API Gateway is a fully managed service for creating, publishing, maintaining, monitoring and securing REST, HTTP and WebSocket APIs. It acts as the front door to your backend — routing requests to Lambda, EC2, or any HTTP endpoint.

## 1. Navigate to API Gateway service

## 2. Create a new HTTP API

## 3. Configure HTTP API

## 4. Configure route

The screenshot shows the 'Configure routes - optional' step in the AWS API Gateway console. On the left, a progress bar indicates the steps: Step 1: Configure API, Step 2: optional: Configure routes (selected), Step 3: optional: Define stages, Step 4: Review and create. The main area is titled 'Configure routes' with an 'Info' link. It explains that routes consist of an HTTP method and a resource path, and lists the supported HTTP methods: GET, POST, PUT, PATCH, HEAD, OPTIONS, and DELETE. Below this, there are three input fields: 'Method' (a dropdown menu with 'GET' selected), 'Resource path' (a text box containing '/hello'), and 'Integration target' (a dropdown menu with 'MyFirstLambda' selected). There is a 'Remove' button next to the integration target. At the bottom left of the form is an 'Add route' button. At the bottom right are four buttons: 'Cancel', 'Review and create', 'Previous', and 'Next'.

## 5. Create a resource and method

The screenshot shows the 'Routes' page in the AWS API Gateway console for an API named 'ArunGateway (i9yw8xxrug)'. A green banner at the top says 'Successfully created API ArunGateway (i9yw8xxrug)'. The left sidebar shows the 'API Gateway' section with options like 'APIs', 'Custom domain names', 'Domain name access associations', and 'VPC links'. Under the 'Develop' section, 'Routes' is selected. The main area is titled 'Routes for ArunGateway' with a 'Create' button. Below this is a search bar and a list of routes. One route is shown with a resource path of '/hello' and a method of 'GET'. To the right of the routes list, there is a 'Choose a route.' prompt. At the top right of the main area are a 'Stage:' dropdown and a 'Deploy' button.

## 6. Integrate API with Lambda function

The screenshot shows the 'API details' page in the AWS API Gateway console for an API named 'ArunGateway'. At the top right, there is a 'Stage:' dropdown and a 'Deploy' button. The 'API details' section contains the following information:

| API ID     | Protocol | Created    |
|------------|----------|------------|
| i9yw8xxrug | HTTP     | 2026-05-06 |

| Description | IP address type | Default endpoint                                                                                                                       |
|-------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| -           | IPv4            | Enabled<br><a href="https://i9yw8xxrug.execute-api.us-east-1.amazonaws.com">https://i9yw8xxrug.execute-api.us-east-1.amazonaws.com</a> |

| ARN                                           |
|-----------------------------------------------|
| arn:aws:apigateway:us-east-1::apis/i9yw8xxrug |

At the top right of the 'API details' section is an 'Edit' button.

## 7. Invoke API using endpoint URL.

## 8. Verify API response
