

AWS Lambda

AWS Lambda is a serverless compute service that allows running code without provisioning or managing servers.

Implementation Steps:

1. Login to AWS Management Console.

2. Navigate to Lambda service.

3. Click Create Function.

A screenshot of the AWS Lambda 'Create function' page. The page shows the 'Create function' heading with an 'Info' link. Below the heading, it says 'Choose one of the following options to create your function.' There are three radio button options: 'Author from scratch' (selected), 'Use a blueprint', and 'Container image'. The 'Author from scratch' option has a description: 'Start with a simple Hello World example.' Below the options, there is a section titled 'Basic information'. Under 'Function name', there is a text input field with 'MyFirstLambda' and a description: 'Enter a name that describes the purpose of your function. Function name must be 1 to 64 characters, must be unique to the Region, and can't include spaces. Valid characters are a-z, A-Z, 0-9, hyphens (-), and underscores ('). Under 'Runtime', there is a dropdown menu with 'Python 3.14' selected and a description: 'Choose the language to use to write your function. Note that the console code editor supports only Node.js, Python, and Ruby.' There is also a 'Permissions' section at the bottom.

4. Select Author from Scratch

5. Enter Function Name and Runtime (Python 3.14)

6. Created a new role

Execution role

To access other AWS services and resources your function needs an IAM role. Choose a role with the right permissions for your function.

 MyFirstLambda-role successfully created.

 [Create new role](#)

7. Write sample Lambda code.

Successfully created the function "MyFirstLambda". You can now change its code and configuration. To invoke your function with a test event, choose "Test".

DEPLOY  Undeployed

Deploy (Ctrl+Shift+U)

Test (Ctrl+Shift+I)

```
1 import json
2
3 def lambda_handler(event, context):
4     # event -> input data (JSON)
5     # context -> runtime information
6     name = event.get('name', 'World')
7     return {
8         'statusCode':
9         200,
10        'body': json.
11        dumps(f'Hello {name}!')
12    }
13
14
```

Amazon Q Tip 1/3: Start typing to get suggestions ([ESC] to

8. Deploy the function and Create test event and execute Lambda.

MyFirstLambda

 The trigger my-alb-log-873 was successfully added to function MyFirstLambda.
